Q1 Prime Number Checker

20 marks

Write pseudocode for a program that accepts an integer from the user and determines whether it is a prime number. The pseudocode should include a loop that checks divisibility from 2 up to the square root of the number (or up to $n-1$), and should clearly state the decision logic used to conclude whether the number is prime or not.

Key Elements Expected: input step, loop with divisibility check, boolean/flag tracking, final decision output.

Your Answer

```
READ n
prime = true
FOR i = 2 To n - 1
  if n % i == 0 THEN
    prime = false
  BREAK
```

Q2 Factorial Calculation

20 marks

Write pseudocode for a program that accepts a non-negative integer n from the user and calculates its factorial ($n!$) using an iterative loop (not recursion). Clearly show the initialization of the result variable, the loop structure, and the final output step.

Key Elements Expected: variable initialization, loop from 1 to n , running product update, output step.

Your Answer

```
START
READ n
fact = 1
FOR i = 1 TO n DO
fact = fact * i
END FOR
```

Q3 Largest Element in an Array

20 marks

Write pseudocode for a program that accepts an array of n integers and determines the largest element in the array. The pseudocode should show the initialization of a variable to track the maximum value, the loop used to traverse the array, and the comparison logic used to update the maximum value when a larger element is found.

Key Elements Expected: max-variable initialization, traversal loop, comparison and update logic, final output.

Your Answer

```
START  
READ n  
FOR i = 0 TO n - 1  
  READ a[i]  
END FOR  
max = a[0]
```

Q4 Palindrome String Checker

20 marks

Write pseudocode for a program that accepts a string from the user and determines whether it is a palindrome (reads the same forwards and backwards). The pseudocode should show how the string is compared character by character (or compared with its reverse), and should clearly state the final decision output.

Key Elements Expected: input step, comparison logic (two-pointer or reversal approach), final decision output.

Your Answer

```
START
READ str
rev = " "
FOR i = LENGTH(str) -1 TO 0
rev = rev + str[i]
END FOR
```

Q5 Simple Interest Calculator

20 marks

Write pseudocode using the IPO (Input, Process, Output) structure to calculate the simple interest on a given principal amount. The pseudocode should clearly show the INPUT section (principal, rate of interest, time in years), the PROCESS section (applying the simple interest formula), and the OUTPUT section (displaying the calculated interest).

Key Elements Expected: INPUT section listing principal, rate, time; PROCESS section showing $SI = (P \times R \times T) / 100$; OUTPUT section displaying the result.

Your Answer

```
START
READ P, R, T
SI = (P * R * T) / 100
PRINT "Simple Interest =", SI
STOP
```
